

Urbanisation: The Changing Face of Settlements

From the fields to the factory—understanding the geography of human aspiration.

THE FIELD

Tatya's Fear: "Suresh, I will come late to the field today... But what about our fields? Will you be able to manage all this?"

THE FACTORY

Suresh's Vision: "I think I should work in that factory... I will get a monthly salary, overtime, and a bonus. Our village will change drastically... huge buildings will stand tall."

The Catalyst: The shift from primary (agriculture) to secondary (industrial) occupations driven by economic promise.

Defining the Shift: When Does a Village Become a City?

Occupation: >75% male working population in non-agricultural sectors.

Population Size: Settlement population > 5,000.

Density: > 400 persons per sq. km.

Key Insight: Urbanisation is a structural shift in governance. The Gram Panchayat gives way to a Municipal Council or Corporation to manage water, roads, and street lighting.

The Indian Growth Story (1961–2011)

Conclusion: The urban population in India is increasing consistently and rapidly.

Engines of Growth: Industry and Trade

Industrialisation

19th-century textile mills in Mumbai

Industries attract manpower, absorbing surrounding villages into metropolitan areas.

Trade

Nagpur

Favourable transport and storage locations create trade hubs.

Connecting the Dots: Transport and Technology

Mechanisation (The Push)

Agriculture becomes mechanized
-> Reduced need for manpower
-> Rural workers seek new jobs

Transport (The Catalyst)

Roads and railways accelerate
urbanisation of small settlements.

Urban Growth

The Great Migration

The Driver:
Attraction of a higher
standard of living.

The Flow:
Rural to Urban,
Rural to Rural,
Urban to Urban.

The Duration: Short-term,
Long-term, or Permanent.

The Urban Promise: Advantages of City Life

Social Harmony

Cultural exchange and melting pots.

Modernisation

Updated knowledge, technology, and wisdom exchange.

Amenities

Advanced healthcare and transport networks.

The Urban Reality: The Housing Crisis

The Gap: Population growth > Housing capacity.

The Consequence: Slums.

- Illegal, temporary structures.
- High density, narrow roads.
- Lack of basic facilities and sanitation.
- Driven by low incomes and high land prices.

Infrastructure Under Pressure

Sprawling suburbs increase commute times. Public transport strain leads to more private vehicles.

Crime & Social Tension

Unemployment leads to illegal means of earning.

Strain on police/judicial systems.
Tension due to soaring land prices.

The Environmental Cost: Pollution

Air Pollution: Smoke billowing from industrial chimneys over a city.

Water Pollution: Dark, untreated wastewater pouring into a river.

Adverse effects on health, accumulating waste, and disease spread.

Managing the Future: The Smart City Mission

Objective: To update cities using Information and Communication Technology (ICT).

Goals:

- Handle urban assets efficiently.
- Planned development.
- Strengthen transport and communication.
- Improve emergency response times.

A Clean Slate: Swachh Bharat Abhiyan

- Improving sanitation and health in urban areas.

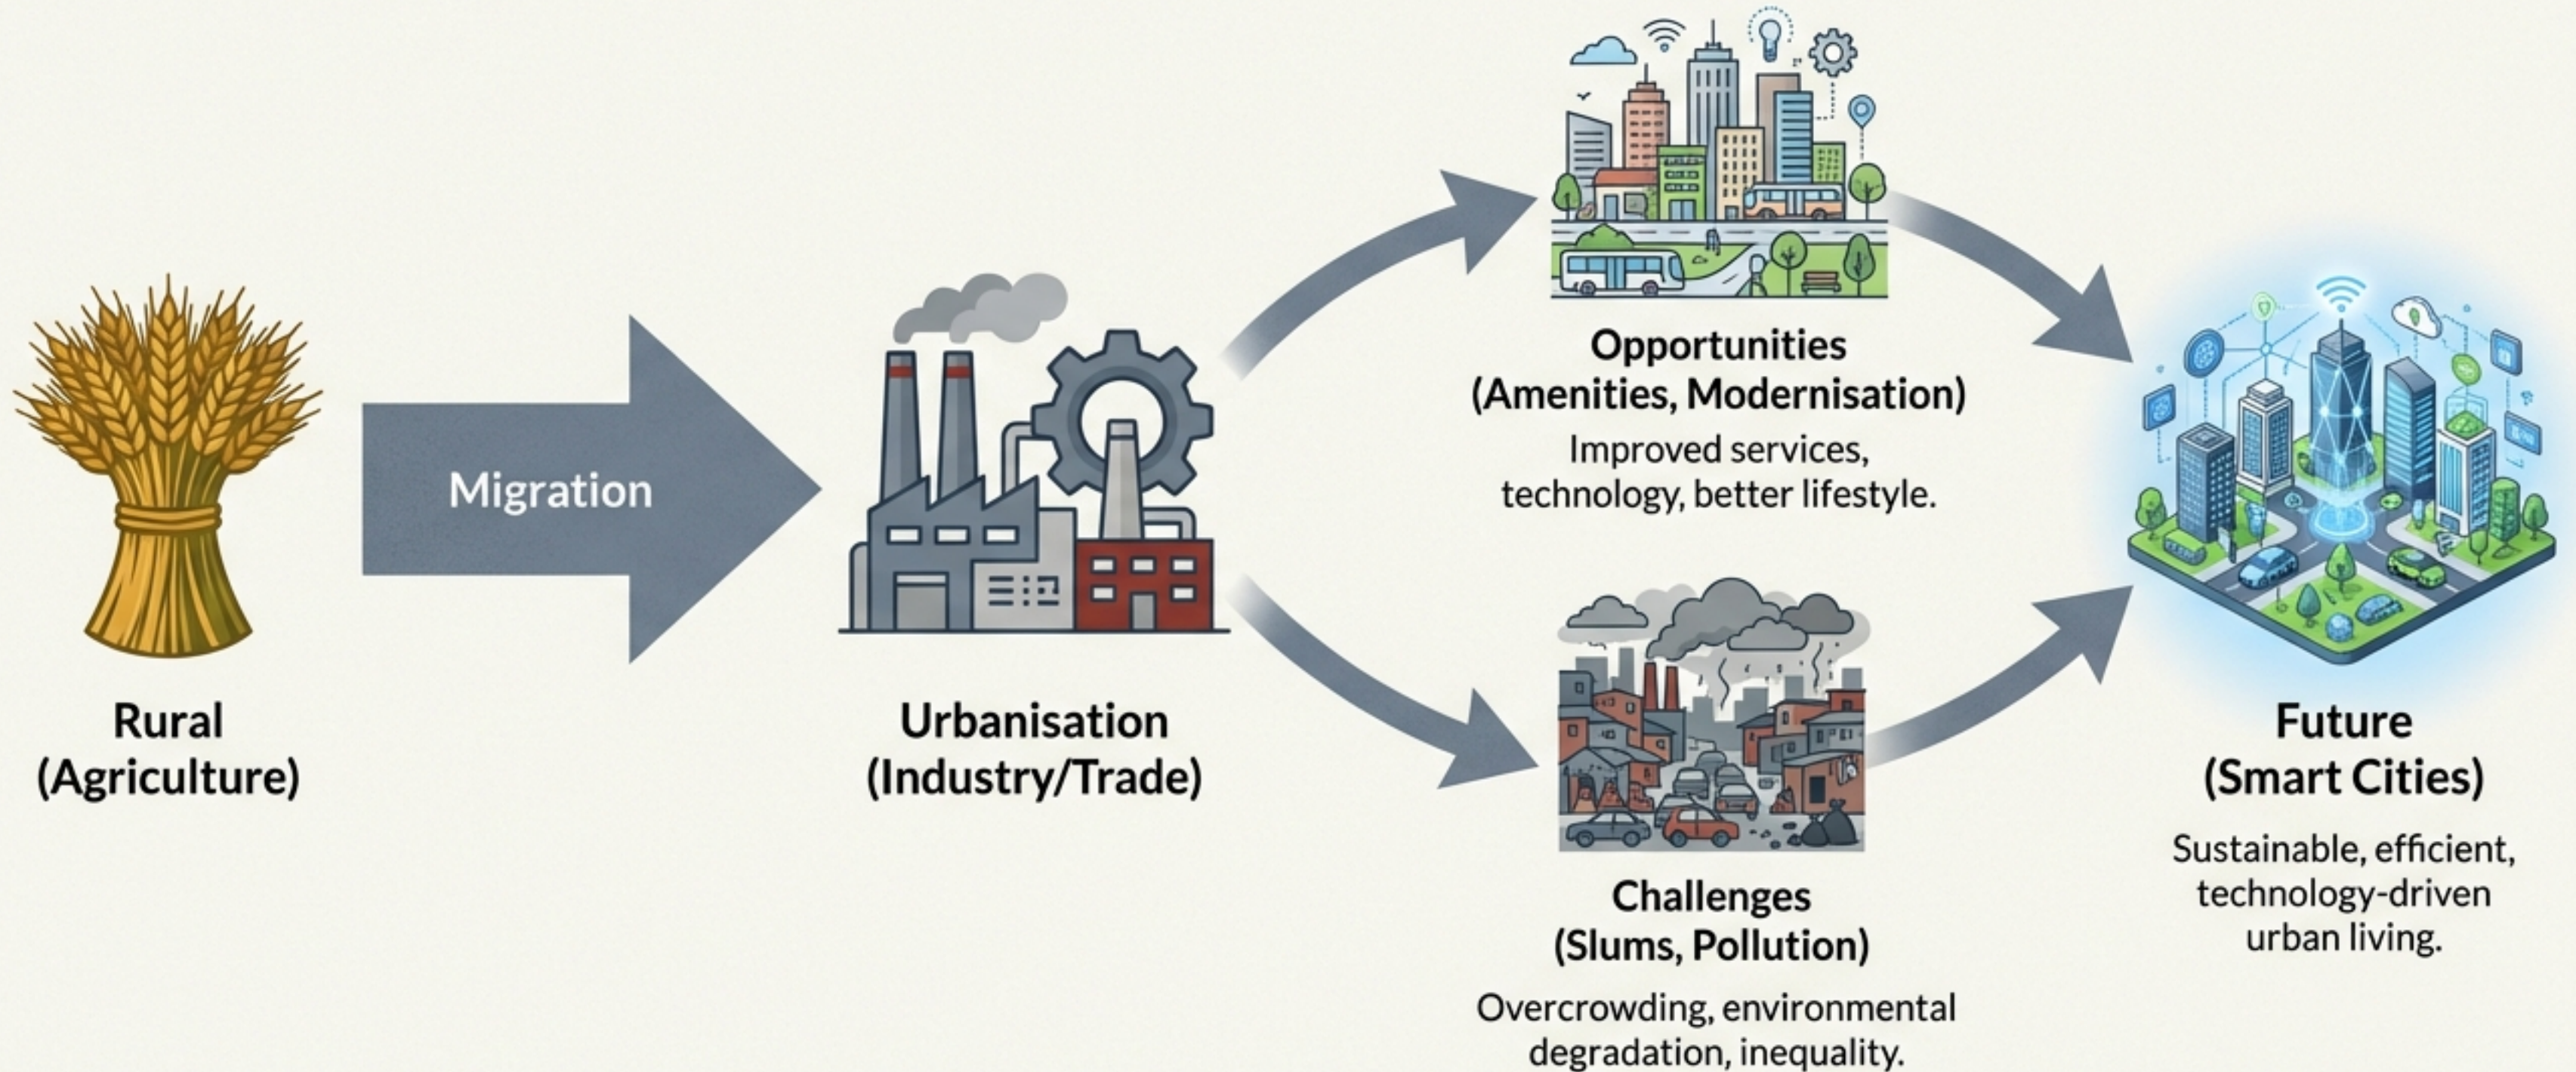

- Addressing the waste management crisis.

- Creating a culture of cleanliness.

Summary: The Urban Continuum

Give it a try: Look at the main transport routes in your own surroundings—how have the settlements there changed in the last five years?
